WISE

Assets adoption

How well customers are adopting it, and what the next 12 months look like

Andrii Morozov | Portfolio project | October 2026

2.25%
convert to Assets
of all signups

3.83%
convert to Assets
of customers who fund a balance

+66%
more Assets customers
same cohort, 12 months on

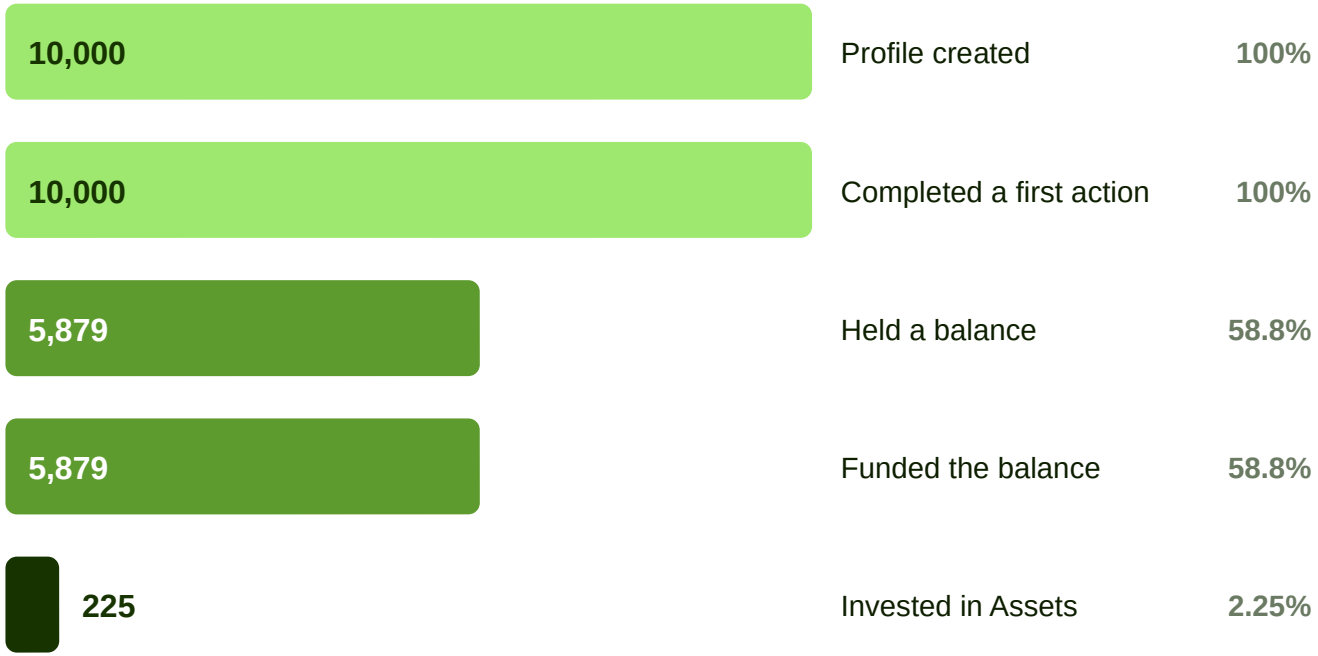

£413m
total holdings
forecast Jun-2024, all customers

Based on 10,000 sampled profiles created Jan-Jun 2023 · 225 of them invested · Built with MySQL, Excel and Power BI

THE FUNNEL

Conversion is 2.25%, but 3.83% is the number to manage

Funnel across all 10,000 sampled profiles

41% never fund a balance and are structurally unable to invest

All 225 investors funded a balance first

Not most of them: every single one. Holding and funding a balance is a hard gate with zero exceptions in 225 cases. Everything else in the product is optional.

So measure conversion on the funded base, not on signups.

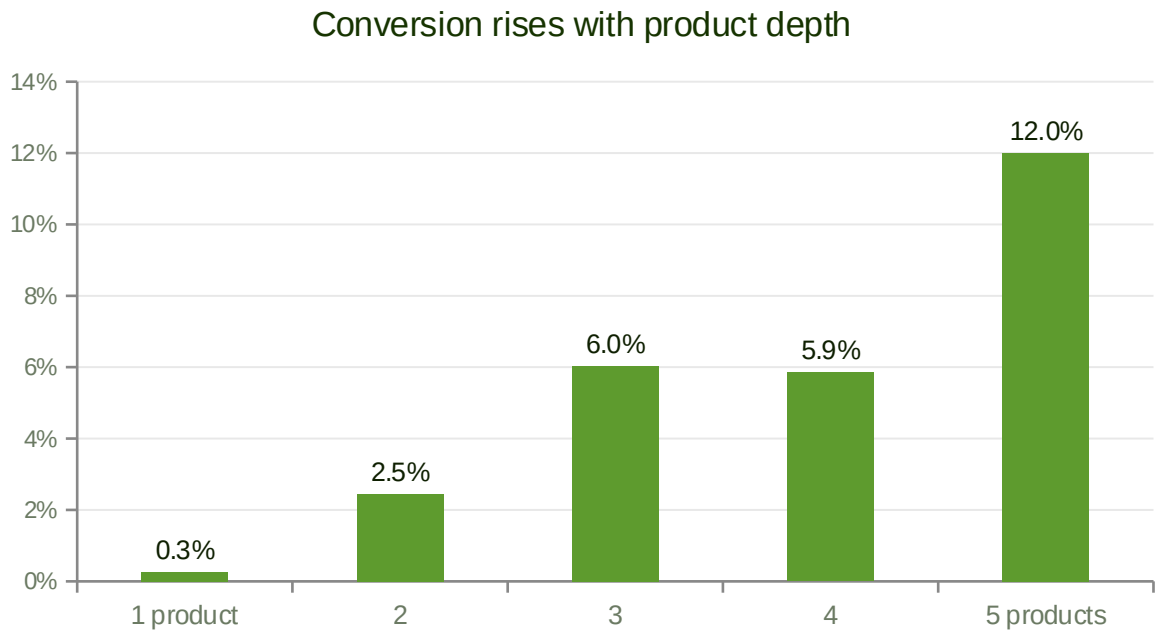

What the 225 investors had already done

Sending money abroad is almost irrelevant to Assets adoption.

WHAT DRIVES CONVERSION

Assets is for money that stays, not money that moves

0.3% at one product → 12.0% at five. A 46x spread.

The signals that hold up

8.1% — **Direct debit users**
vs 3.8% funded average, the strongest single behavioural marker

7.5% — **Customers holding £10k+ cash**
vs 3.4% for customers who keep nothing at Wise

4.2% — **Business customers**
but only 1.2x once you control for funding, so mostly a funding effect

0.7% — **Customers who send money abroad**
the only product NEGATIVELY associated with investing

These are associations, not causal effects. The common thread: conversion tracks how far Wise is the customer's primary account.

CUSTOMER FORECAST

Adoption is accelerating: the raw monthly trend hides it

The trap

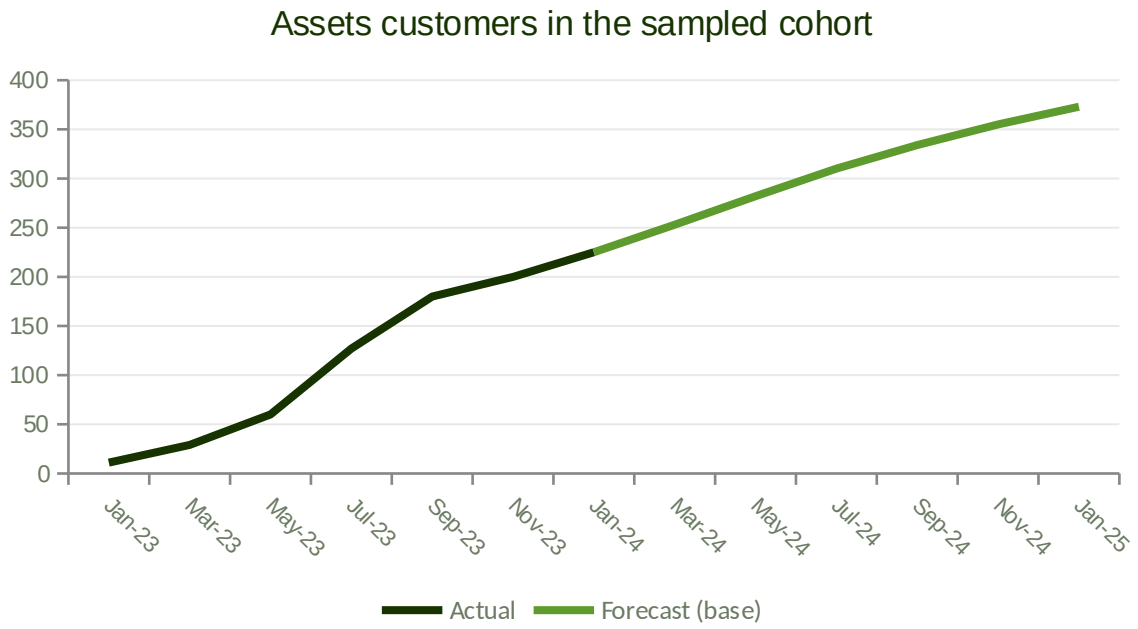

Monthly sign-ups peak in Jun-2023 then fall. But nobody joins this sample after Jun-2023, so the group is simply ageing. A falling line is what a fixed, ageing pool always looks like.

The fix: compare cohorts at equal age

At 7 months old

1.33%	→	2.80%	2.1x
Jan-23 cohort		Jun-23 cohort	

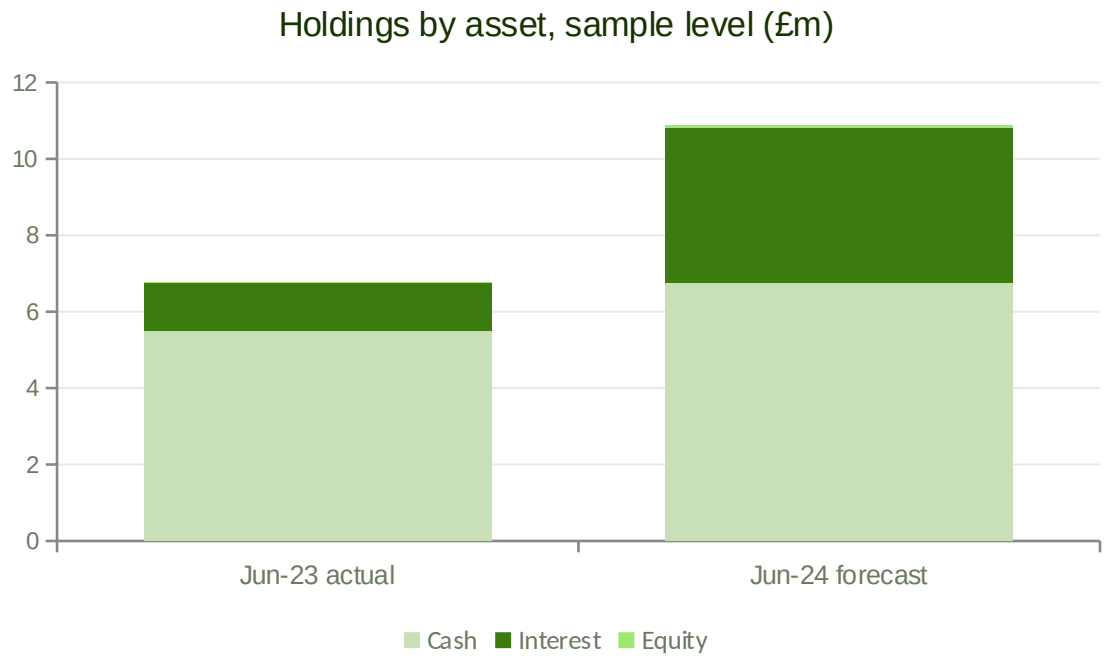

Method: chain-ladder on a cohort development triangle. Age-to-age growth factors taken from the observed data, tail decayed beyond month 12. Cross-check: the model implies 8-15 new investors a month through 2024 against 8-14 actually observed.

	Jan-2024	Jan-2025	
Sampled cohort (10,000 profiles)	225	373	+66%
Whole customer base, 2023 vintages on	17.7k	52.7k	3.0x

HOLDINGS FORECAST

Assets is an interest business, and a concentrated one

Cash £5.50m → £6.76m **Interest £1.25m → £4.05m** **Equity £19k → £57k**

Assets move from 19% to 38% of everything customers hold.

Method: holdings driven off the customer forecast (holders x balance per holder), not extrapolated directly. Growth on existing balances is damped from the 54%/42%/16% launch ramp, and new joiners are added at their observed smaller size (median first deposit fell from ~£1,000 to ~£400).

Scaled to the whole customer base

	Jun-2023	Jun-2024	
Interest	£47.7m	**£154m**	3.2x
Equity	£0.7m	**£2.2m**	3.1x
Cash	£209m	**£257m**	1.2x
Total holdings	£258m	**£413m**	1.6x

The risk worth naming

The five largest holders are ~61% of all interest balances. One of them leaving moves the total more than a month of new adopters does.

Four things I would change

01 Report Assets conversion on the funded base

Signups are the wrong denominator: 41% of them can never convert. Funding a balance is a separate growth problem that owns the larger loss.

02 Trigger the Assets prompt on balance behaviour

The moment a customer tops up, sets a direct debit, or crosses £1k in cash is the highest-probability moment. Direct debit users convert at 2.1x.

03 Stop marketing Assets on the send-money journey

It is the one product negatively associated with investing, and it is the largest share of traffic. That spend is better placed elsewhere.

04 Treat interest concentration as a retention priority

Five customers hold 61% of the interest book. Protecting them is worth more than a month of new adopters.

What this analysis cannot see

Only profiles created Jan-Jun 2023 are in the data, so every population figure understates the true total, as pre-2023 customers are absent entirely. · 225 converters is a small base; cuts below ~50 customers are directional only. · The three data tables end in different months, so each question is forecast 12 months from its own latest month.

METHOD AND TOOLS

One analysis, three tools, the same numbers

1 MySQL

Clean, check and model

- Loaded the raw data and ran 13 import checks before any analysis
- Rebuilt the funnel, drivers and cohort triangle in SQL
- CTEs (incl. recursive), window functions and views feed Power BI

2 Excel

Forecast model

- Chain-ladder on the cohort triangle, with three scenarios for the tail
- Holdings = holders x balance per holder, scaled x38 to the full base
- Tidy forecast tables exposed for Power BI

3 Power BI

Interactive dashboard

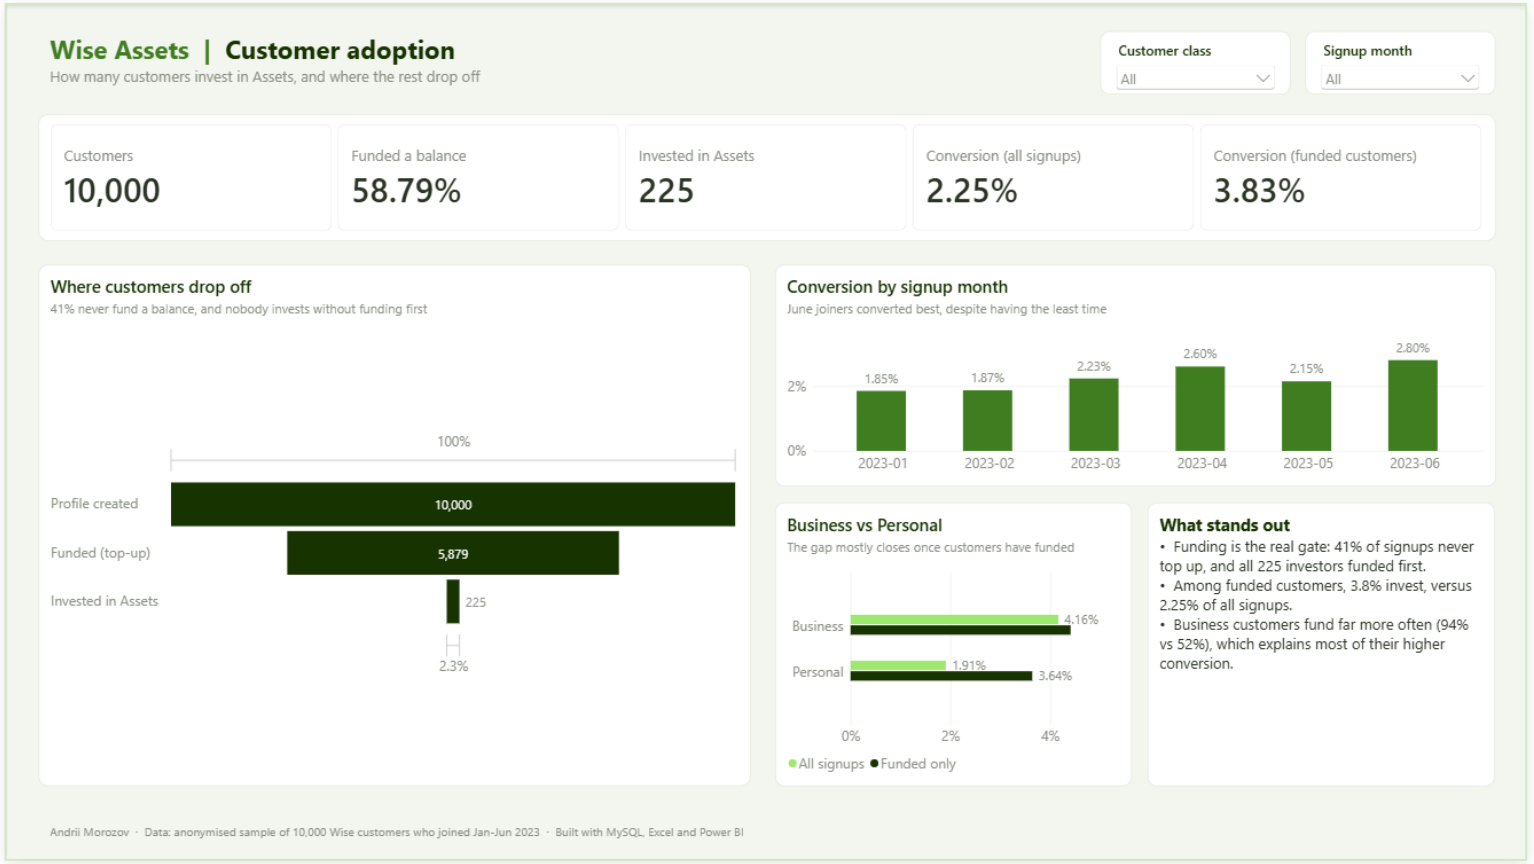

- Three pages: adoption, who invests, 12-month forecast
- 29 DAX measures, a DAX-coloured cohort heatmap and a custom theme
- What-if slider on new-investor growth updates every forecast

Reconciled across all three: 10,000 / 5,879 / 225 · 2.25% and 3.83% · direct debit 8.09% · Jan vs Jun cohort at month 7: 1.33% vs 2.80%

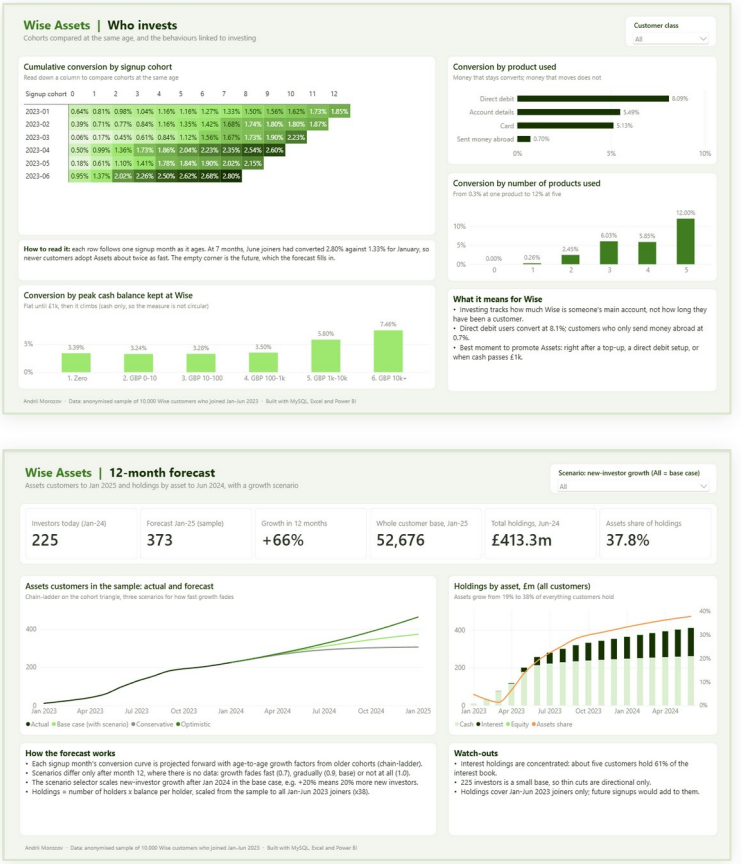

Code, workbook and dashboard: github.com/frostovandrey/wise-assets-analysis

POWER BI DASHBOARD

The analysis as a three-page dashboard

Customer adoption: funnel, conversion by signup month, Business vs Personal

Who invests (top) and **12-month forecast** (bottom)
